Document ID: PSTK-BE-202605-817K-001

Project: Secure Payment Gateway Architecture
(Paystack)
Client: AmazingPay

Date: May 25, 2026
Status: Finalized

Below is the itemized cost breakdown of the engineering work, security implementation, and infrastructure tooling required to establish a fully automated payment backend.

DESCRIPTION OF SERVICES	AMOUNT (NGN)
1. Core Payment API Initialization & Routing Dynamic session generation, multi-channel configuration, and transaction reference management.	150,000
2. Webhook & Real-Time Event Listener System Secure server endpoint construction and asynchronous status event parsing.	180,000
3. Cryptographic Security & Authentication HMAC SHA-512 signature validation and strict environment variable security separation.	120,000
4. Database Integration & Automated Fulfillment Real-time status sync and automated service provisioning logic.	160,000
5. Idempotency, Error Handling & Edge-Case Management Duplicate transaction prevention and graceful API failure handling.	95,000
6. QA, Sandbox Testing & Live Migration Comprehensive sandbox simulation and live environment deployment.	85,000
7. Infrastructure & Advanced Tooling Costs Antigravity AI compute credits for architecture optimization and code generation.	27,000

DESCRIPTION OF SERVICES	AMOUNT (NGN)
TOTAL INFRASTRUCTURE SETUP:	817,000

**Note: This cost reflects the creation of a fully automated, highly secure payment engine. Unlike a simple plugin, this custom backend ensures the platform is protected from payment fraud, requires zero manual payment verification by staff, and is built to handle high transaction volumes seamlessly.*
